

Preparation

Remove original bar end weight.

Fitting Procedure

Shown for left side, repeat for right side with applicable parts.

Loosely assemble clamp and saddle (4) to the handlebar next to the mirror/clutch lever bracket. The perch would need to be moved outward to give clearance for the switch. **See Image 1.**

Loosely attach the handguard backbone to the handlebar end with bar end Weight (12), spacer (9) and bolts (7) & (8) as per diagram.

The preferred backbone position is horizontal or slightly below when viewed from the side.

Tighten all bolts in the following order (7), (8) then (5) and (6) evenly. Use recommended torque specifications over page.

Fitting Tips:

Brake lever mounting saddle needs to be loosened to get saddle behind the master cylinder. Make sure to use spacer (10) and washer (11) for the right side.

Recommended Torque Settings	
M6	10 Nm (7.4 lbf ft)
M8	20 Nm (14.8 lbf ft)
M10	21 Nm (15.5 lbf ft)

CAUTION:

Installation of the handguard is safety-relevant work and can be complicated. We recommend the installation be performed by a motorcycle service technician. Rideworx accepts no liability for damages caused by improper mounting. All screws, bolts and nuts, including all replacement hardware provided by Rideworx, should be tightened to the torque specified in the table. After the first 50km of riding check all screws, bolts and nuts are tightened to the correct torque. We recommend a medium strength liquid thread lock product on all fasteners.

WARNING:

Check operation of all handlebar controls, specifically the throttle, front brake, kill switch and clutch to ensure they are operating correctly and are in accordance with the OEM specifications. Do not ride the motorcycle if any controls are not operating correctly or if rear view mirror vision is obscured. Check periodically that all bolts are tight.
